

# KUMÃ

Microcrédito P2P para Empreendedores Brasileiros

## Product Requirements Document (PRD)

Version 1.0 · June 2026

Audience: Product & Engineering Teams

---

## 1. Product Overview

Kumã is a peer-to-peer (P2P) microlending platform connecting small business owners in Brazil with individual investors. The name Kumã is rooted in Tupi-Guarani, reflecting the platform's deep connection to Brazilian culture and its mission of community-driven growth.

The platform serves two distinct user types — Investors and Entrepreneurs — each with a tailored experience designed around their specific goals, motivations, and financial literacy levels.

### Core Value Propositions

- For Investors: access to curated microlending opportunities with transparent return rates and a proprietary Kumã Score that quantifies credit risk.
- For Entrepreneurs: a fast, dignified onboarding experience that generates a financial profile, surfaces business health insights, and connects them with investors.

- For the ecosystem: financial education embedded into the product loop, progressively improving the creditworthiness of the entrepreneur base over time.
- 

## 2. User Types & Personas

### 2.1 Investor Side

Investors are individuals seeking to deploy capital into microloans. Upon onboarding, investors are classified into one of two profiles via a short quiz (see Section 4.1). These profiles drive which UI layout and which data emphasis they see throughout the product.

#### Profile A — The Impact Investor

Motivated primarily by the social and human dimension of the investment. This investor wants to feel connected to the person they are funding.

##### What they see:

- Rich story cards featuring the entrepreneur's photo, short video, business name, and personal narrative.
- Loan purpose stated in plain, humanised language (e.g. 'I need R\$2,000 to buy a new commercial oven for my bakery').
- Loan amount requested and repayment timeline.
- The Kumã Score is shown, but as a secondary element — not the lead.

#### Profile B — The Returns Investor

Motivated primarily by financial performance. This investor wants to quickly assess risk and expected return before engaging with the entrepreneur's story.

##### What they see:

- The Kumã Score displayed prominently as the primary element on each card.
- Expected return rate for the specific loan, clearly shown.
- Loan amount and repayment terms.
- A condensed version of the entrepreneur's profile is available but is not the lead element.

### 2.2 Entrepreneur Side

Entrepreneurs are Brazilian small business owners seeking microloans to sustain or grow their operations. They may have limited financial literacy and limited access to traditional credit. The onboarding experience is designed to be simple, non-intimidating, and rewarding — with immediate value delivered in the form of financial health insights before any loan matching begins.

---

## 3. Investor Experience — Detailed Flow

### 3.1 Onboarding & Profile Quiz

When an investor first logs into Kumã, they are taken through a short profiling quiz before reaching the main investment feed. The quiz determines whether they are Profile A (Impact) or Profile B (Returns).

### Recommended Quiz Structure (5 questions)

Each question should be presented one at a time, with a progress indicator. Questions should be framed in plain, conversational language — not financial jargon. Suggested questions:

**Q1.** When you think about investing your money, what matters most to you?

- A. Knowing that my money is helping someone build a better life.
- B. Knowing exactly how much I'll earn and when.

**Q2.** You're browsing investment opportunities. You see a profile with a great story but an average credit score. What do you do?

- A. I feel curious — I want to read more about their story.
- B. I skip it — the score is what tells me if it's worth it.

**Q3.** How do you feel when you think about the people behind your investments?

- A. It's important — I want to feel connected to them.
- B. It's nice, but what I really care about is the numbers.

**Q4.** You receive a return on your loan. What makes you most satisfied?

- A. Hearing that the entrepreneur's business is doing well.
- B. Seeing the expected return credited to my account.

**Q5.** A friend asks why you use Kumã. You say:

- A. I get to help real people and make a difference.
- B. It's a smart way to diversify and earn good returns.

### Scoring Logic

3+ answers of A → Profile A (Impact Investor). 3+ answers of B → Profile B (Returns Investor). Tie → the system defaults to Profile A, but the investor can manually switch profiles in their settings at any time.

**⚠ Note:** The quiz result should be stored per user account and used to personalise every subsequent session. Investors must be able to re-take or override the quiz result from their settings page.

## 3.2 Investment Feed

After the quiz (or on subsequent logins), the investor is taken to their personalised feed of entrepreneur profiles. Feed rendering differs by profile:

### Profile A — Story-Forward Card

- Hero: entrepreneur photo or short video (autoplay, muted, looped — max 30 seconds).
- Entrepreneur name and business name.
- Handwritten-style loan purpose statement (max 280 characters).
- Loan amount and term.
- Kumã Score shown as a secondary badge.
- CTA button: Invest in [First Name]'s story

### Profile B — Score-Forward Card

- Hero: Kumã Score displayed as a large, prominent visual element (e.g. circular gauge or bold number).
  - Expected return rate displayed directly below the score.
  - Loan amount and term.
  - Collapsible section: entrepreneur name, business, and brief description.
  - CTA button: View full profile and invest
- 

## 4. Entrepreneur Experience — Detailed Flow

### 4.1 Onboarding

The entrepreneur onboarding is designed to be the simplest possible path from sign-up to a complete financial profile. It is broken into three stages:

#### Stage 1 — Basic Profile & Story

- Full name, CPF, and date of birth.
- Business name and type (MEI, ME, food stall, etc.).
- City and neighborhood.
- A short personal statement: why they need the loan and what they will use it for (max 280 characters — shown to investors).
- Photo upload (profile photo and optional additional photos of their business).
- Optional: short video upload (max 30 seconds).

#### Stage 2 — Business Data Collection

Business data is used to populate the entrepreneur's profile and to feed the Kumã Score algorithm. Entrepreneurs have three paths for data input:

##### Option A — iFood Integration

If the entrepreneur has an active merchant account on iFood, they can link it to Kumã. This allows the platform to pull business performance data including order volume, average ticket size, customer ratings, and operational activity.

**⚠ Note:** iFood's official partner API ([developer.ifood.com.br](https://developer.ifood.com.br)) is a merchant-facing API that requires a formal partnership agreement with iFood for third-party data access. The Kumã team must establish this partnership before this feature can be built. Until the partnership is in place, this option should be hidden in production and available only in internal testing environments.

##### Option B — Google Business Profile Integration

If the entrepreneur has a Google Business Profile, they can connect it via Google's OAuth 2.0 flow. Kumã can then read publicly available and account-level data such as business category, operating hours, customer reviews and ratings, and location data.

**⚠ Note:** Google Business Profile API requires the app to be verified by Google and to go through their Places API and Business Profile API approval process. Scope: `'https://www.googleapis.com/auth/business.manage'`. This must be scoped minimally to read-only business data.

## Option C — Manual Input

Entrepreneurs who cannot or do not wish to link external platforms can manually enter business data via a guided form. Required fields: estimated monthly revenue, number of years in operation, number of employees (if any), and primary product or service offered.

## Stage 3 — Financial Data Collection

This is the most critical data collection stage and the foundation of the Kumã Score. Entrepreneurs have two paths: automatic connection via Belvo (preferred) or manual upload of bank statements. Both paths must be offered at all times.

### Path A — Automatic via Belvo (OFDA)

Kumã integrates with Belvo, a regulated Open Finance Data Aggregation (OFDA) partner for Latin America, to securely retrieve the entrepreneur's financial data from Brazil's Open Finance Network. Belvo abstracts the full complexity of Open Finance Brasil compliance — BCB registration, FAPI security, consent management — and exposes it through a single, developer-friendly API and a hosted widget.

### What Belvo Retrieves Automatically

Once the entrepreneur grants consent, Belvo automatically retrieves the last 12 months of data across the following resources:

- Owner: full name, CPF/CNPJ, contact information, ID documents, financial profile (occupation, declared income). Used to verify entrepreneur identity.
- Accounts: all checking, savings, credit card, and loan accounts at the connected institution — including balances, overdraft limits, and credit utilisation.
- Transactions: full inflow/outflow transaction history including date, amount, description, and counterparty. Pix transaction patterns are included.
- Bills: monthly credit card bill data for each card account.
- Balances: high-level balance snapshots including available, blocked, and auto-invested amounts.

### Belvo Consent & Link Model

In Belvo's model, a consent is the entrepreneur's agreement to share their Open Finance data from a given institution. Each consent maps one-to-one to a Belvo link — Belvo's internal identifier for that user-institution connection. Key rules:

- Only the entrepreneur can renew or revoke their consent. Kumã can delete a link (which triggers automatic consent revocation on Belvo's side), but cannot revoke on the user's behalf.
- If an entrepreneur's consent expires (Belvo sends a webhook event), they must reconnect via the widget. Kumã must surface a clear in-app prompt when this occurs.
- If Kumã deletes a link as part of offboarding, all associated data is removed from Belvo's systems and the consent is permanently revoked. This action is irreversible.
- Entrepreneurs must be able to manage their consents via My Belvo Portal (MBP). Kumã must embed or link to MBP — this is a regulatory requirement under Open Finance Brasil rules.

### Belvo Consent Flow (as experienced by the entrepreneur)

1. Entrepreneur reaches the Connect your bank screen inside Kumã. CPF and full name must already be collected at this point (required by Belvo for consent initiation).

2. Kumā's backend calls Belvo's token endpoint to generate a short-lived access token for the widget session.
3. Kumā launches the Belvo Hosted Widget as a webview inside the app. The widget is fully branded to Kumā (Belvo supports custom branding and colour configuration).
4. The entrepreneur selects their bank, is redirected to the bank's own app or portal to authenticate and approve data sharing, then redirected back to the Belvo widget.
5. The widget sends a success callback event to Kumā including the link\_id. Kumā stores this link\_id mapped to the entrepreneur's account.
6. Belvo asynchronously retrieves 12 months of historical data and fires webhook events (historical\_update) for each resource: OWNERS, ACCOUNTS, TRANSACTIONS, BILLS.
7. Kumā's backend listens for these webhooks, fetches the data via GET /owners/, GET /accounts/, GET /transactions/ (filtered by link\_id), and triggers Kumā Score computation.
8. The entrepreneur sees a loading screen while the score computes, then transitions to their dashboard.

**⚠ Note:** Belvo's OFDA integration handles BCB regulatory compliance (FAPI 1.0 Advanced security, consent audit logs, revocation flows) on Kumā's behalf. Kumā still needs to maintain its own data processing records per LGPD requirements. Webhook handling must be implemented before launch — data is never pushed synchronously.

### Path B — Manual Bank Statement Upload

For entrepreneurs who are unable or unwilling to connect via Open Finance (e.g. their bank is not yet on the Open Finance network, or they have privacy concerns), Kumā offers a manual upload path. This path yields a score but the score will be weighted lower than one generated from Belvo data, and this should be communicated transparently to the entrepreneur.

#### Accepted File Types

- PDF bank statements (exported directly from the bank's app or internet banking portal).
- CSV or XLS exports where the bank offers them.
- Maximum 3 months of statements required; 6 months recommended for a higher score.

#### Processing Pipeline

9. Entrepreneur uploads file(s) via a guided upload screen. Each file is validated on upload (correct format, not password-protected, not corrupted).
10. Kumā's backend passes the file(s) through a parsing pipeline. PDFs are processed via OCR or structured text extraction depending on whether the PDF is machine-readable.
11. Parsed transactions are normalised into the same data schema used by Belvo (date, amount, description, transaction type: CREDIT/DEBIT) to ensure the Kumā Score engine receives consistent input regardless of path.
12. A fraud detection check runs on the parsed data to flag obvious anomalies (e.g. inconsistent date ranges, duplicate transactions, formatting inconsistent with known bank templates).
13. Score is computed. Entrepreneur is notified once processing is complete (target: under 5 minutes for most uploads).

**⚠ Note:** Manual upload scores carry a confidence penalty in the Kumā Score algorithm. The entrepreneur must be told clearly: 'Connecting your bank directly gives you a more complete score. Your current score is based on uploaded statements only.' The UI

should always offer a one-tap shortcut to upgrade to Belvo connection from the dashboard.

## 4.2 Entrepreneur Dashboard

Once onboarding is complete and financial data has been fetched, the entrepreneur is taken to their dashboard. This dashboard has three primary sections:

### 1. My Profile Preview

Shows the entrepreneur exactly how investors will see their card — both in Story-Forward and Score-Forward formats. This helps them understand what they are presenting to the market.

### 2. Financial Health Insights

A simplified, visual breakdown of their financial position generated from the Open Finance data. Designed to be educational and non-intimidating. Includes:

- Average monthly revenue (last 6 months).
- Average monthly expenses.
- Estimated cash flow balance.
- A simple visual indicator: Stable / Attention Needed / At Risk.
- Plain-language commentary: e.g. Your revenue grew 12% over the last 3 months — great sign for investors.

### 3. Kumā Score & Investor Matching Status

Displays the entrepreneur's Kumā Score with a plain-language explanation of what the score means and what factors influence it. Below the score, a status message informs the entrepreneur of their matching status:

- Searching for investors for your business (active matching in progress).
- You have a new investor interested — review and accept.
- Your loan is funded — here are your repayment details.

## 4.3 Financial Education Module

To increase the quality of the entrepreneur base and improve overall Kumā Score distributions over time, the platform includes an in-app Financial Education module. This is surfaced contextually — when the Kumā Score is shown, a secondary prompt invites the entrepreneur to improve it.

### Module Design Principles

- Bite-sized: each lesson is max 5 minutes, designed for mobile consumption.
- Progress-linked: completing a lesson or module triggers a re-evaluation of the relevant score components, giving the entrepreneur immediate positive feedback.
- Contextually triggered: if the score is low due to a specific factor (e.g. irregular cash flow), the relevant course is surfaced as a recommendation, not a generic list.
- Plain Portuguese: no financial jargon. Visuals and short videos preferred over walls of text.

### Suggested Course Catalogue (v1)

- Understanding Cash Flow: how to read your money in vs. money out.
- Building Credit History: what lenders look at and how to improve it.

- Separating Personal and Business Finances: why it matters and how to do it.
- Pricing Your Product or Service: a simple margin calculator.
- What Investors Want: how to tell your business story.

**⚠ Note:** Course completion data must feed back into the Kumã Score algorithm. Define which score sub-components are influenced by which courses before development begins.

---

## 5. Kumã Score

The Kumã Score is the platform's proprietary creditworthiness metric. It is the primary signal used by Returns Investors and a secondary signal used by Impact Investors. It is also the primary personal development metric for entrepreneurs.

### 5.1 Score Range & Display

Recommended range: 0–1000, displayed as a whole number. Visual treatment: circular gauge with colour bands (red 0–400, amber 401–650, green 651–850, blue 851–1000).

### 5.2 Score Inputs (v1)

The following data sources feed the Kumã Score. Exact weighting should be defined by the data science team before development begins, but the recommended input categories are:

- Financial data via Belvo (OFDA): cash flow stability, average balance, existing debt load, Pix transaction patterns, payment history. Highest weight. Scores generated from this path carry full confidence.
- Financial data via manual upload: same metrics derived from parsed bank statements. Carries a confidence penalty weighting vs. Belvo path. Entrepreneur is always shown which path their current score is based on.
- Business data: time in operation, revenue trend, platform activity (iFood/Google ratings if available).
- Profile completeness: whether the entrepreneur has provided photos, video, personal statement, and linked at least one external data source.
- Financial education completion: courses completed within the Kumã platform.

### 5.3 Score Transparency

Entrepreneurs must always be shown a plain-language breakdown of their score. Example: Your score is 620. Your biggest opportunity to improve is in Payment History (currently Attention Needed). Completing the course Building Credit History may help.

**⚠ Note:** Do not show entrepreneurs the exact weighting formula. Show them the directional factors and what actions they can take. This prevents gaming while preserving motivation.

---

## 6. Technical & Regulatory Dependencies

|                                                |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Belvo (OFDA Partner)</b>                    | Kumã uses Belvo as its Open Finance Data Aggregation partner. Belvo manages BCB regulatory compliance, FAPI security, consent flows, and data normalisation. Required: Belvo production account, API credentials (Secret ID + Password), webhook endpoint configured. Resources used: Owners, Accounts, Transactions, Bills, Balances. Webhook events: historical_update, new_transactions_available, consent_expired. |
| <b>Belvo My Belvo Portal</b>                   | BCB regulation requires users to have an accessible way to manage their Open Finance consents. Kumã must link to or embed Meu Portal Belvo ( <a href="https://meuportal.belvo.com">https://meuportal.belvo.com</a> ). The Customized MBP option (showing only consents for Kumã's app) is recommended over the public universal instance.                                                                              |
| <b>Manual Statement Processing</b>             | PDF/CSV bank statement uploads require a parsing pipeline with OCR capability for scanned PDFs. Output must be normalised to match the Belvo transaction schema (date, amount, description, CREDIT/DEBIT type). A fraud/anomaly detection layer is required before score computation. Recommended: build as a separate microservice.                                                                                   |
| <b>LGPD Compliance</b>                         | All personal and financial data collected must comply with Brazil's Lei Geral de Proteção de Dados (LGPD, Law 13.709/2018). A Data Processing Agreement (DPA) and privacy policy must be in place before launch.                                                                                                                                                                                                       |
| <b>iFood Partnership</b>                       | Third-party access to merchant business data via iFood requires a formal partnership agreement. This is not achievable through public APIs alone. Treat as a Phase 2 feature pending business development.                                                                                                                                                                                                             |
| <b>Google Business Profile API</b>             | Requires Google API Console project setup, OAuth 2.0 verification, and scoped access approval for 'business.manage'. Read-only scope only.                                                                                                                                                                                                                                                                             |
| <b>CPF/CNPJ Validation</b>                     | All entrepreneur accounts must validate CPF (individual) and optionally CNPJ (business) against federal revenue data before loan activation.                                                                                                                                                                                                                                                                           |
| <b>Data Retention &amp; Consent Revocation</b> | Open Finance consents must be revocable by the user at any time. Revocation must trigger data deletion within BCB-mandated timeframes. Full audit log required.                                                                                                                                                                                                                                                        |

## 7. Out of Scope — v1

The following items are explicitly excluded from the v1 scope of this PRD and should not be built until a subsequent version is specified:

- Loan repayment management and collections flows.
  - International investor or entrepreneur onboarding.
  - Secondary market for loan trading between investors.
  - In-app messaging between investors and entrepreneurs.
  - Automated KYC/AML verification (must be defined in a separate compliance PRD).
  - iFood integration (pending partnership — Phase 2).
-

## 8. Open Questions for the Team

- 8.1 What is the minimum Kumã Score threshold required for an entrepreneur's profile to be shown to investors? Who defines this?
- 8.2 How are interest rates and return rates calculated and who bears regulatory responsibility — Kumã or the investor?
- 8.3 What is the investor identity verification (KYC) process and which provider will be used?
- 8.4 Will Kumã hold funds in escrow, or will the payment flow go directly between investor and entrepreneur? What banking licence does this require?
- 8.5 How frequently is the Kumã Score recalculated? What event triggers a recalculation (new Open Finance data, course completion, time-based)?
- 8.6 What happens if an entrepreneur's Open Finance consent lapses or is revoked mid-loan? What is the data retention policy in that scenario?
